Moov

An E-hailing App · UX & Product Design Case Study

Motolani Deborah Akinyemi · Designed 2020

> **A quick note before you scroll.** *Moov was my very first product design project, built back in 2020 when I was just finding my feet in design. I have come back to it recently and cleaned up a few details, but the thinking and the work are exactly as they were. This is the project that brought me so much thrill and excitement, and it is where I fell in love with the process. I still look back on it fondly.*

Imagine this. You are almost done getting dressed for work. You have a bowl of oats on the dining table waiting for you. You calmly get dressed, eat your breakfast, adjust your tie or skirt, and step out of your building just in time as a decent Toyota Corolla pulls up with a decent driver who says, "Hi, I'm your ride." **Yup, you did not need to imagine it. It is already a thing.** E-hailing services have been around for a while, and they are here to stay.

About Moov

Moov is a ride-hailing app for requesting fast and affordable rides. Its aim is comfort, speed, and affordability.

The Challenge

To create a design that users could relate with and use with ease, I set out to find the real problems people face when booking their rides. My aim was to understand the communication gap between the customer and the driver, and to run a competitive analysis of other e-hailing services, so I built my questionnaire around exactly that.

I circulated the survey links to different groups across several social media platforms to collect responses. I also read through articles on Medium about passenger issues. After a few days, I gathered the data, built my competitive analysis and user personas, and noted the common problems.

The Problems Users Face

- Poor attitude and behaviour from some cab drivers, and drivers cancelling the ride without informing the passenger.
- Being overcharged because some drivers are not familiar with the city routes.

- Poor driving quality and car hygiene.
- Late arrival and no punctuality from drivers.
- Having to endure a ride with an aggressive driver out of fear.

Competitive Analysis

App	Strengths	Weaknesses
Uber	Ride sharing, so users can split a fare; live driver tracking; two-way ratings that keep drivers and passengers accountable; set car-model standards.	Surge pricing; not available in some states; expensive.
Bolt	Intuitive interface; affordable; gives a payment estimate upfront; referral bonus for inviting friends and family; supports cashless payments.	Not as widespread across the country; a narrower selection of car types than competitors; drivers are often unprofessional.

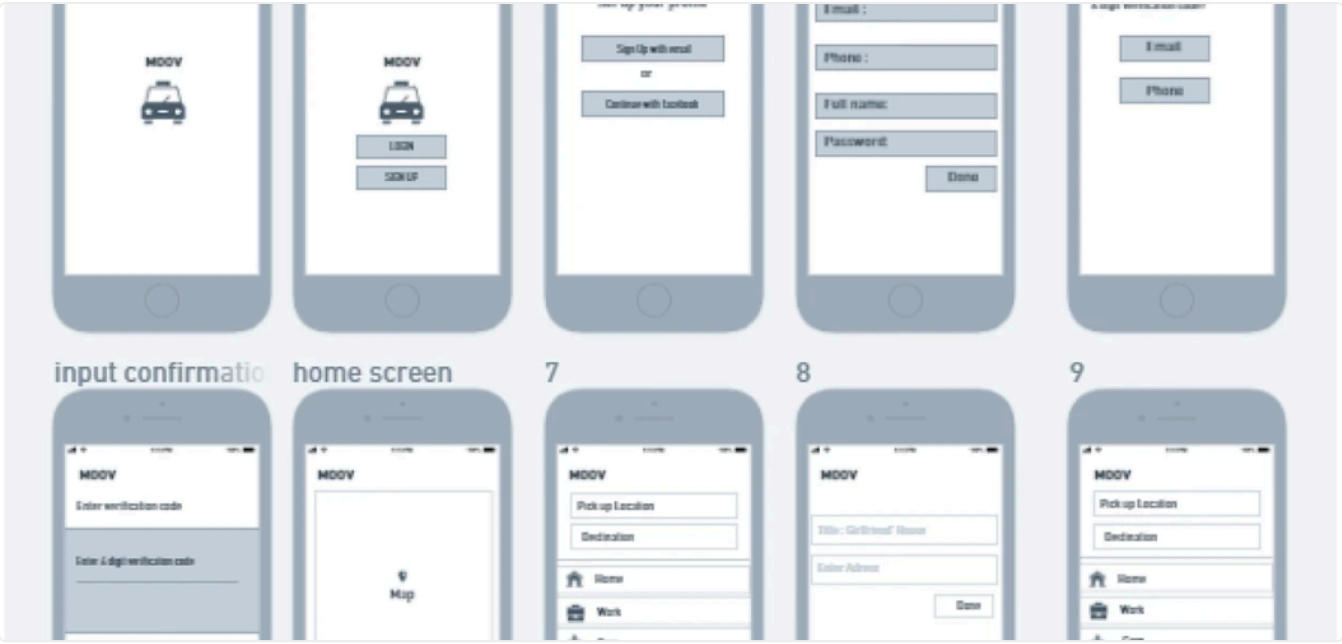

User Personas

From the research, I designed for three users:

- **Immanuel**, a hotel manager in Lagos who books cabs to move between his two hotels. He needs a tidy car, a safe and quality journey, pickups and drop-offs on time, and no communication problems with the driver.
- **Yvonne**, a 23-year-old graduate interning in the city. She needs to move around without sharing a ride with strangers, a way to share her trip details with trusted friends for safety, an easy way to alert nearby security if she feels in danger, and cashless payments.
- **Natasha**, who is three months pregnant and travels for regular antenatal checkups and cannot drive herself. She needs an intuitive app, a driver who respects her wish for a smooth, non-bumpy ride, in-app payment so she is not holding cash, and a ride history she can show her protective husband.

Sketches & Wireframes

I started on paper, mapping out every screen and flow by hand before moving into software. From there I built digital wireframes for the full journey: splash, sign-up and verification, the home and booking screens, payment, the on-trip view, and the profile and wallet.

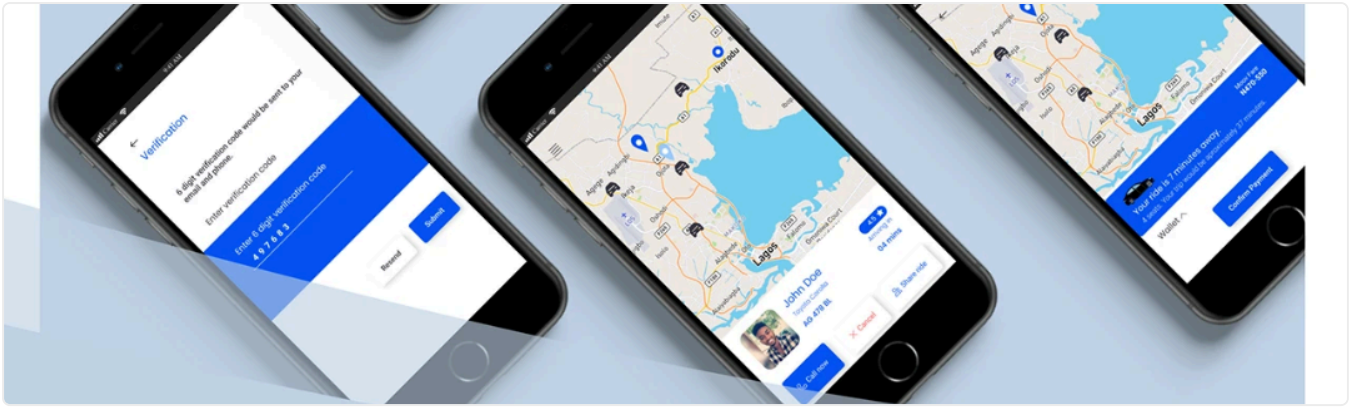

Low-fidelity wireframes: splash, sign-up, verification, home, and booking flows

High Fidelity

Then the final screens, built out in Moov's blue identity: the splash and sign-up, the profile and wallet menu, the live map and on-trip view, driver details, the fare estimate and payment confirmation, and the rating screen.

Splash, sign-up, profile and wallet, live map, driver details, payment, and rating

---

I got introduced to design in July, and Moov was my very first project, designed that September. It brought me so much thrill and excitement, and I would genuinely love your feedback on it.
